Continued Examination Under 37 CFR 1.114

A request for continued examination under 37 CFR 1.114, including the fee set forth in 37 CFR 1.17(c), was filed in this application after final rejection. Since this application is eligible for continued examination under 37 CFR 1.114, and the fee set forth in 37 CFR 1.17(c) has been timely paid, the finality of the previous Office action has been withdrawn pursuant to 37 CFR 1.114. Applicant's submission filed on 14 January 2008 has been entered.

EXAMINER'S COMMENT

In view of applicant's response filed 14 January 2008, where independent claims 1, 13, and 24 each have been amended to define the claimed invention(s) to further include, regarding claims 1 and 13, "wherein interference of the first engagement surface with the first interference surface couples the gripping device to the actuation member and holds the gripping device in the locked position", and regarding claim 24, "wherein engagement of the first protrusion against the limit stop and engagement of the locking member against the first projection or the first protrusion couple the gripping device to the actuation member and hold the gripping device in the locked position", and further in view of applicant's remarks on beginning of page 10 of the filed response, which have been incorporated as the reasons for allowance of all pending claims, claims 1-11, 13-22, 24-32, and 34-36 are allowed. Applicant's remarks pertaining to Shook where

"the teeth 6 and 7 of Shook do not hold the clutch member 5' in a locked position. Shook teaches that the expansible member E or spring engages an abutment for maintaining the crank C normally free of the shaft S. Shook, Pg. 1, Col. 2, 11. 96-101. Thus in Shook the crank C is normally free of the shaft S and the clutch member 5' is normally free from the clutch member 5. In fact in Shook the clutch members 5 and 5' engaged via the application of physical force by a user. In particular, a user must exert a physical force on the crank C in/he direction of clutch member 5 hat is sufficient to overcome the biasing force exerted by the spring E before the clutch member 5' will engage with the clutch member 5. Once in this position, it is the continued application of this force hat holds the clutch member 5' ha this position, rather than interference between the teeth 6 and 7. Removal of this force results in the spring E returning the clutch 5' to its normal disengaged position. In view of the foregoing, Applicant respectfully submits that Shook fails to teach or suggest a locked position, wherein the interference of the first engagement surface with the first interference surface ... holds the gripping device in the locked position, as recited in claims 1 and 13. Furthermore, in view of the foregoing, Applicant respectfully submits that Shook fails to teach or suggest a locked position, wherein engagement

Art Unit: 3677

of the first protrusion against the limit stop and engagement of the locking member against the first projection or the first protrusion...hold the gripping device in the locked position, as recited in claim 24.”,

is found persuasive. Therefore, the claim rejections indicated in the prior Office action each have been withdrawn.
